

REQUIREMENT ANALYSIS PHASE

Project Title

A CRM APPLICATION FOR THE CHAI SHOP & CO

1. Introduction

The Requirement Analysis Phase identifies and documents the requirements needed to develop the CRM application for **The Chai Shop & Co.**

The purpose of this phase is to understand what the system should do, what users require, and what technical and operational requirements are needed to implement the proposed Salesforce CRM solution.

The requirements are divided into **functional requirements, non-functional requirements, solution requirements, and technology requirements.**

2. User Story

Topic: User Story

The main user story describes the requirement from the perspective of a sales representative.

A sales representative needs to manage customer relationships efficiently. The system should allow the representative to manage employer information and maintain online and offline customer records using appropriate record types.

The system should also automate order quantity and total bill calculations, generate reports and dashboards, and automate birthday offer emails for customers.

3. Functional Requirements

Topic: Functional Requirements

Functional requirements describe the major functions that the CRM application must provide.

The project document identifies the following functional requirements:

Requirement ID	Functional Requirement	Description
FR-1	User Login	Allows users to securely access the CRM system.
FR-2	Object Creation	Provides required Salesforce objects for managing business data.
FR-3	Data Entry	Allows users to enter and maintain customer and business information.
FR-4	Billing Automation	Automatically calculates order-related billing information.
FR-5	Report Generation	Generates reports based on customer and sales information.
FR-6	Email Automation	Automates customer email communication.

These six functional requirements are specified in the original project document.

4. User Login Requirement

Topic: User Authentication

The system must provide a login mechanism for authorized users.

The login function allows users to access the CRM application and use the features according to their access level.

The project also identifies **user role management** as one of the system requirements.

5. Customer and Business Data Management

Topic: Data Management

The CRM application must maintain important business information in an organized manner.

The system supports management of:

- Customer records
- Employer information
- Enterprise accounts
- Orders and sales information
- Customer-related information

This centralized data management helps users access and maintain business information within Salesforce.

6. Billing Automation Requirement

Topic: Automated Billing

The system must automate the calculation of order-related billing information.

The project includes order quantity and total bill calculations as part of the sales process. This reduces manual calculation and helps maintain consistency in billing information.

7. Report Generation Requirement

Topic: Reports

The system must provide reports for analyzing customer and sales information.

The project includes reports such as:

- Customer Account Sales Report
- Enterprise Account Sales Report

These reports help users view and analyze sales-related information.

8. Email Automation Requirement

Topic: Email Notifications

The system must support automated email communication with customers.

The project includes a birthday email automation process. A scheduled-triggered flow checks customer birthday information and sends the configured email when the required conditions are satisfied.

9. Non-Functional Requirements

Topic: Non-Functional Requirements

Non-functional requirements describe the quality and operational characteristics expected from the system.

The project document identifies the following non-functional requirements:

1. **Usability**
2. **Security**
3. **Performance**
4. **Availability**
5. **Scalability**

These requirements define how effectively and reliably the CRM system should operate.

10. Usability Requirement

Topic: Usability

The CRM application should provide a user-friendly environment that allows users to work with customer and sales information efficiently.

Users should be able to access the required records, enter information, and use system functions without unnecessary complexity.

11. Security Requirement

Topic: Security

The system must protect CRM information and restrict access to authorized users.

User login and role management are included to support controlled access to the Salesforce application.

12. Performance Requirement

Topic: Performance

The CRM system should perform its functions efficiently when users access and manage customer and sales information.

Performance testing is included in the project to evaluate system behavior under concurrent usage.

13. Availability Requirement

Topic: Availability

The CRM application should be available to authorized users when they need to access customer, sales, reporting, and other CRM functions.

The Salesforce platform provides the environment in which the application functions are configured and used.

14. Scalability Requirement

Topic: Scalability

The system should support the management of increasing amounts of customer and business information.

The CRM design includes customer, employer, enterprise, sales, reporting, and automation features that support the business management requirements identified in the project.

15. Solution Requirements

Topic: Solution Requirements

The proposed CRM solution requires the following major system capabilities:

- Customer record management
- Employer management
- Enterprise account management
- Order management
- Automated billing
- Validation rules
- Record types

- Page layouts
- Global picklists
- Email notifications
- Flow automation
- Reports
- Dashboards
- User and role management

These capabilities form the main solution requirements of the CRM application.

16. Technology Requirements

Topic: Technology Requirements

The project uses Salesforce technologies for application development and deployment.

Technology	Purpose
Salesforce Lightning	User interface and frontend
Salesforce Cloud Database	Data storage
Salesforce Platform	Application platform
Salesforce Flows	Business process automation
Reports and Dashboards	Data analysis and visualization

The technology stack is specified in the project document.

17. Requirement Analysis Summary

Topic: Requirement Summary

The Requirement Analysis Phase defines the functions and qualities required for the The Chai Shop&Co CRM application.

The major requirements include:

- Secure user access
- Customer and business data management
- Automated billing
- Data validation
- Email automation
- Report generation
- Dashboard creation
- Flow automation
- Performance and scalability
- User and role management

These requirements provide the foundation for designing and developing the Salesforce CRM application.

18. Conclusion

Topic: Requirement Analysis Conclusion

The Requirement Analysis Phase identifies the functional and non-functional requirements of the **TheChai Shop&Co CRM application**.

The analysis establishes what the system should provide to its users and identifies the Salesforce technologies required to implement the solution.

The completed requirements serve as the basis for the next phase, **Project Design Phase**, where the system architecture, data flow, objects, relationships, page layouts, and record types are designed.
