

A CRM APPLICATION FOR THE CHAI SHOP & CO.

PHASE 6 – PROJECT TESTING PHASE

1. Introduction

The Project Testing Phase verifies whether the CRM application works according to the specified requirements. Testing identifies functional errors, interface problems, data issues, access-control problems, and integration defects. During this phase, all major modules of the CRM application are tested individually as well as together. The testing process begins with the **Login and Authentication Module**, where valid and invalid usernames, passwords, and user access permissions are checked. The **Customer Management Module** is tested to verify whether users can successfully add, view, edit, search, and manage customer information. The **Order Management Module** is tested to ensure that order details are entered correctly, stored properly, updated when required, and displayed accurately.

2. Testing Objectives

TC01 – Login	Valid credentials → dashboard should open.
TC02 – Invalid Login	Incorrect credentials → login should be rejected.
TC03 – Add Customer	Valid details → customer should be stored.
TC04 – Edit Customer	Modified details → updated information should appear.
TC05 – Search Customer	Valid name/phone → matching record should appear.
TC06 – Add Order	Valid order → order should be stored and linked to customer.
TC07 – Feedback	Valid feedback → feedback should be recorded.
TC08 – Role Access	Staff tries admin-only function → access should be denied.
TC09 – Logout	Logout → session should end and login page should appear.

TC10 – Validation	Missing required data → validation message should appear and invalid data should not be stored.
-------------------	---

- Verify every major CRM function.
- Check valid and invalid inputs.
- Verify database operations and data consistency.
- Confirm role-based permissions.
- Check integrated modules.
- Ensure usability and reliability.

3. Testing Types

- Unit Testing – tests individual functions or modules.
- Integration Testing – checks communication between modules.
- System Testing – verifies the complete application.
- User Acceptance Testing – checks practical user requirements.
- Security Testing – verifies authentication and role-based access.

4. Sample Test Cases

The sample test cases are used to verify the main functions of the CRM application. The expected results are compared with the actual results obtained during testing. When the actual result matches the expected result, the test case is considered **Passed**. If the results differ, the issue is identified, corrected, and tested again.

These test cases help ensure that the CRM application performs correctly, handles invalid inputs properly, protects user access, and maintains customer and business data accurately.

5. Defect Management

When an error is found, it is recorded, analyzed, corrected, and tested again. Regression testing is performed after important fixes to ensure existing functions continue to work. **Defect Management** Defect Management is an important part of the testing phase of the **CRM Application for The Chai Shop & Co.** It involves identifying, recording, analyzing, fixing, and retesting errors found during application testing. Defects may occur in areas such as login, customer management, order processing, feedback, database operations, or user access. When a defect is identified, it is documented with details such as the defect description, affected module, severity, and status. The development team analyzes the cause of the problem and makes the necessary corrections. After fixing the defect, the affected feature is tested again to confirm that the problem has been resolved and that no new issues have been introduced. Proper defect management helps improve the reliability, quality, security, and overall performance of the CRM application.

6. Expected Testing Result

The expected result is a stable CRM application in which authentication, customer management, order management, interaction tracking, feedback, reports, and role-based access work according to the designed requirements. Defect Management is an important part of the testing phase of the **CRM Application for The Chai Shop & Co.** It involves identifying, recording, analyzing, fixing, and retesting errors found during application testing. Defects may occur in areas such as login, customer management, order processing, feedback, database operations, or user access. When a defect is identified, it is documented with details such as the defect description, affected module, severity, and status. The development team analyzes the cause of the problem and makes the necessary corrections. After fixing the defect, the affected feature is tested again to confirm that the problem has been resolved and that no new issues have been introduced. Proper defect management helps improve the reliability, quality, security, and overall performance of the CRM application.

7. Conclusion

The Project Testing Phase ensures that the **CRM Application for The Chai Shop & Co.** works correctly and meets the defined requirements. By testing each major module, identifying defects, correcting errors, and performing retesting, the overall quality and reliability of the application are improved. The testing process also helps ensure proper data management, user access, security, and system performance.

Successful completion of this phase confirms that the CRM application is stable, user-friendly, and ready for the final project demonstration. Testing provides confidence that the CRM application is ready for deployment and demonstration. Identified defects should be corrected and final test results documented before submission.

THANK YOU
